# REVISED Assessment Questions 

## Pre- and Post Test

## QR Pre-Test Assessment

Instructions: The goal of this assessment instrument is to evaluate your ability to use and interpret numbers with application to conditional probability. Tit will not be graded but you are required to submit the assignment.

The table below shows a sample of the Bronx residents (by gender) surveyed with or without undergraduate degrees. Use this table to answer Questions 1 \&2:

|  | With undergrad degree | Without undergrad degree |
| :--- | :---: | :---: |
| Men | 900 | 600 |
| Women | 800 | 600 |

Question 1: Which of the following represents a "conditional probability" statement for the information shown on the Table?
(a) The probability of picking a man in the Bronx is $52 \%$.
(b) Of the total number of men surveyed in the Bronx, the probability of finding a man with an undergrad degree is $60 \%$.
(c) Of those surveyed in the Bronx, the probability of picking a woman is $48 \%$.

Question 2: Is it true that "Most of the Bronx residents with undergraduate degrees are women"? Write and explain your answer.

Question 3: Suppose the Bronx has 10,000 residents and $10 \%$ of these residents are found to be carriers of tuberculosis (TB). Among $65 \%$ of these TB carriers, the TB test results were found to be negative. For the non-carriers of TB, the test results were positive for $15 \%$. Based on this information, (a) construct a two-way table; (b) calculate the probability that a Bronx resident who is found to have positive test result actually is a carrier, and (c) write and explain how you derive probability value.

Question 4: It was reported in the news that "The Independent candidate is more likely to win the Mayor election in NYC if there is a higher turnout of younger voters." Based on this report, would you feel confident in saying that the chance of the Independent candidate winning the election is positively related to the high turnout of the younger voters? Why or why not?

## QR Post-Test Assessment

Instructions: The goal of this assessment instrument is to evaluate your ability to use and interpret numbers with application to conditional probability. Tit will not be graded but you are required to submit the assignment.

The table below shows a sample of the Lehman College students (by gender) surveyed by STEM and Non-STEM Majors. Use this table to answer Questions 1 \&2:

|  | STEM Majors | Non-STEM Majors |
| :--- | :---: | :---: |
| Men | 1000 | 900 |
| Women | 1200 | 750 |

Question 1: Which of the following represents a "conditional probability" statement for the information shown on the Table?
(a) The probability of picking a STEM major is $57 \%$.
(b) Of the total number of Lehman female students surveyed, the probability of finding a Non-STEM major is $38 \%$.
© Of those students surveyed at Lehman, the probability of picking a female student is $51 \%$.
Question 2: Is it true that "Most of the Lehman college students in Non-STEM majors are women"? Write and explain your answer.

Question 3: Suppose the NYC has 15,000 residents and $15 \%$ of these residents are found to be carriers of HIV-virus. Among 55\% of these HIV- carriers, the test results were found to be negative. For the non-carriers of HIV, the test results were positive for $35 \%$. Based on this information, (a) construct a two-way table; (b) calculate the probability that a NYC resident who is found to have negative test result actually is a non-carrier, and (c) write and explain how you derive probability value

Question 4: It was reported in the news that "The probability of a female Presidential candidate winning in the U.S. Presidential election is higher with a larger turnout of female voters." Based on this report, would you feel confident in saying that the chance of a female candidate winning the election is positively related to the high turnout of the female voters? Why or why not?

## Grading rubric

## Question 1:

| (a) | (b) | © |
| :---: | :---: | :---: |
| 0 point | 1 point | 0 point |

## Question 2:

| No | Yes |
| :---: | :---: |
| 1 point | 0 point |

Written explanation:

| 5 points | 3 points | 1 point |
| :--- | :--- | :--- |
| A full sentence which <br> includes an <br> explanation on <br> looking at the number <br> of women under the <br> column for "with <br> undergrad. degree" <br> and comparing it to <br> the number for "men" <br> under the same | Some reference is <br> made in writing about <br> looking at the number <br> column and noting <br> cor the women under <br> column for "with <br> undergrad degree" <br> without giving <br> explicit explanations | No written <br> explanation given; <br> Incorrect use of table <br> information (e,g. <br> comparing rows for a <br> given column); |

## Question 3:

(a) Construction of two-way table:

| 2 points | 1 point | 0 point |
| :--- | :--- | :--- |
| Correctly constructed | Partially correct | No table |

(b) Calculation of conditional probability

| 2 points | 1 point | $\mathbf{0}$ point |
| :--- | :--- | :--- |
| Correctly calculated | Partially correct | No calculation |

(c) Explanation of calculation:

| 2 points | 1 point | 0 point |
| :---: | :---: | :---: |
| Correct and full explanation of | Partially correct explanation | No explanation is given |

| how the calculation is <br> conducted; includes reference to <br> the right row and column. | of how the calculation is <br> conducted; includes reference <br> to the right row and column. |  |
| :--- | :--- | :--- |

## Question 4:

| No | Yes |
| :---: | :---: |
| 0 point | 1 point |

Did the student explain that the independent's win is dependent on having a higher turnout of the younger voters?

| No | Yes |
| :---: | :---: |
| 0 point | 1 point |
