**Quiz on Race**

**True or False**

- 1) Human populations are unambiguous, clearly demarcated, biologically distinct groups known as 'races'. DNA testing proves the distinctions between races (i.e., black, white, Asian, etc.)
- 2) There is greater genetic variation within "racial" groups than between them.
- 3) Historical research has shown that the idea of "race" has always carried more meanings than mere physical differences.
- 4) The system of racial classification in the United States is still used on the census and as a factor in many kinds of data collections.
