

# Leveraging the Raspberry Pi for CS Education

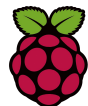

**Joel Adams, Calvin College  
(Moderator)**

**Richard Brown, St. Olaf College**

**Jalal Kawash, University of Calgary**

**Suzanne Matthews, West Point**

**Elizabeth Shoop, Macalester College**

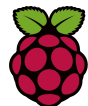

# 75-Minute Session Overview

1. Panelist presentations (~50 min.)
2. All-group Q&A (~25 min.)

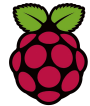

These slides will be available at:

**[CSinParallel.org > Workshops > SIGCSE2018](#)**

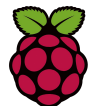

# An Inexpensive, Quick Laptop Setup for the Raspberry Pi

Richard A. Brown  
St Olaf College

# The Raspberry Pi and PDC

- ***Parallel and Distributed Computing (PDC)*** is now expected for CS majors (CS2013)
  - Virtually all machines are multicore – even phones
  - Role of web services, cloud computing, etc.
- *The Raspberry Pi provides an inexpensive, hands-on platform for teaching PDC concepts*

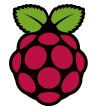

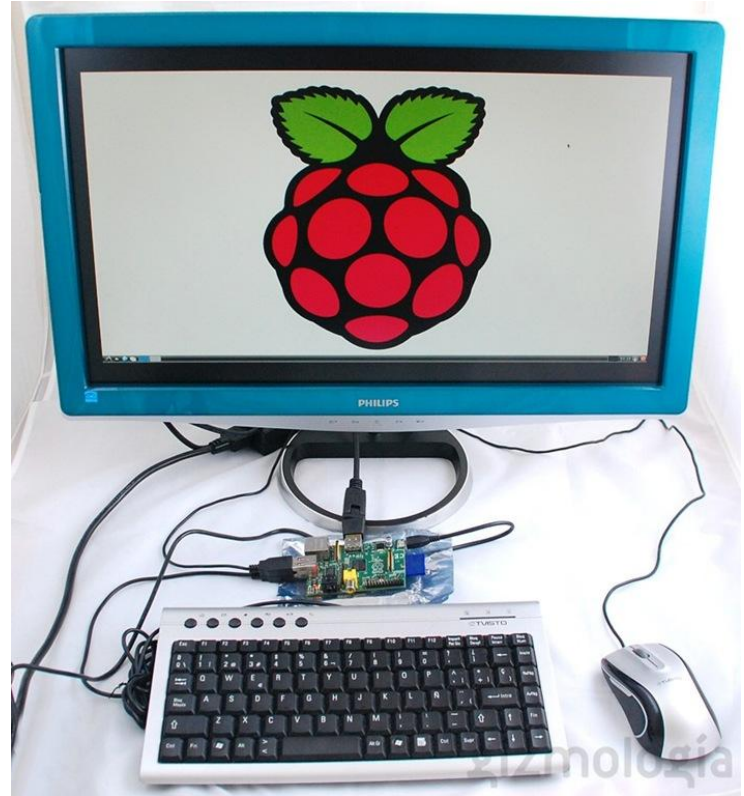

# Fast Ethernet

# Monitor/Keyboard/Mouse to Pi

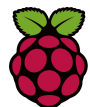

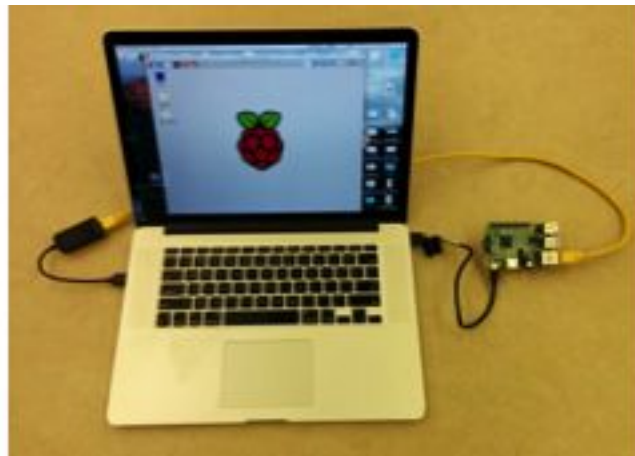

- Traditional setup for using Pi's
- Requires equipment (monitor, etc.)
- In-class setup time
  - unless preset in lab

# A laptop-based R-Pi setup

- Inexpensive, versatile, *quickly deployed* Raspberry Pi setup, using a laptop

Kit  
~\$50, pi  
included

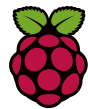

# Video project

Margaret  
Zimmermann

Jesus  
Caballero

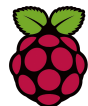

PDC course project by  
two juniors, Fall '16

- Create teaching videos
  - Download/install/test a Pi system image
  - Laptop setup
  - Support multiple OS's
- Teach with videos in two classes

# Video project - teaching

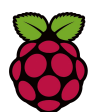

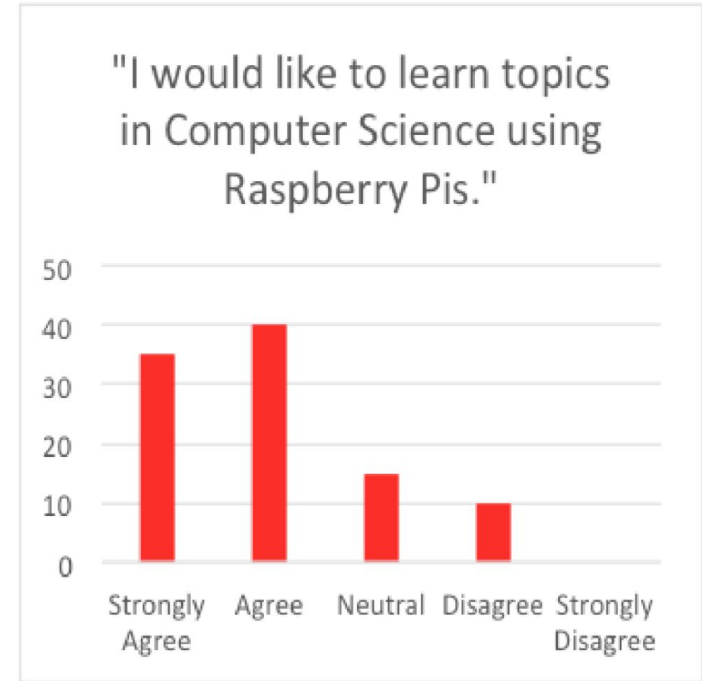

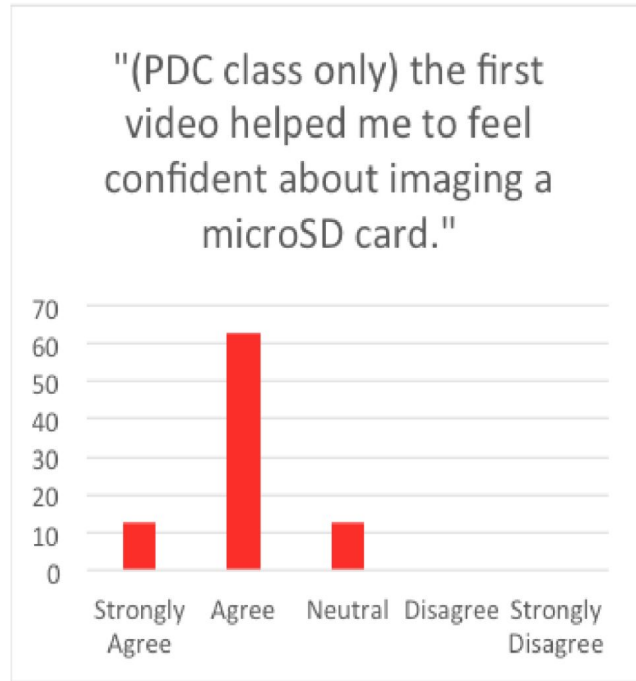

- Margaret and Jesus led teaching activities with their videos in two courses in Fall '16
- PDC course (CS 300):
  - “Flipped” exercise/lab to install a Pi system image
  - Followup PDC exercises in class on Pi's/their image
- Hardware Design course (CS 241, cf. Cpt. Org.):
  - In-class exercise to watch video, perform laptop setup, carry out a multicore computation on Pi

# Video project - teaching

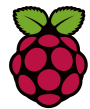

Well-  
received  
by students

HD:  
**Only 25 min**  
for video +  
laptop +  
exercise!

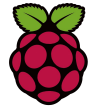

# Next steps

- Self-configuring clusters
  - Single system image
  - Run script to start head node, but not worker node
  - Auto-recognize cluster changes/update config
- Container-based deployment on SBCs
  - Update system software without reimaging!
  - Platform not limited to Raspberry Pi

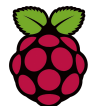

# Programming for Embedded Systems Using the Raspberry Pi

Jalal Kawash  
University of Calgary

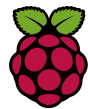

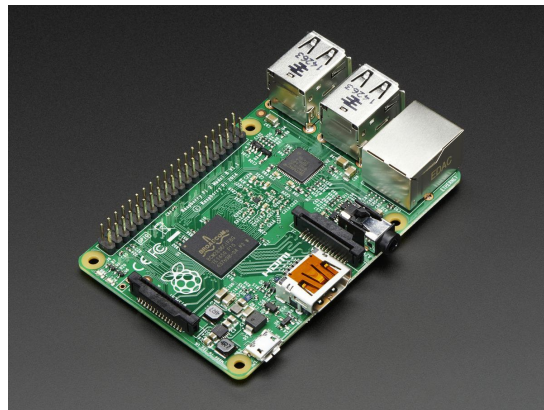

# The Course

- Computing Machinery II
- Second in a series of low-level courses
- Focus on the hardware/Software interface
  - Digital logic
  - Microarchitecture
  - Interrupts
  - Device drivers
  - Frame buffers

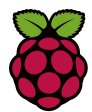

# Module Objectives

- Advanced ARM Assembly Programming
- General-Purpose Input/Output
- Universal Asynchronous Receiver/Transmitter Protocol
- Video Programming
- Interrupts and Exceptions

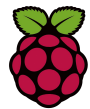

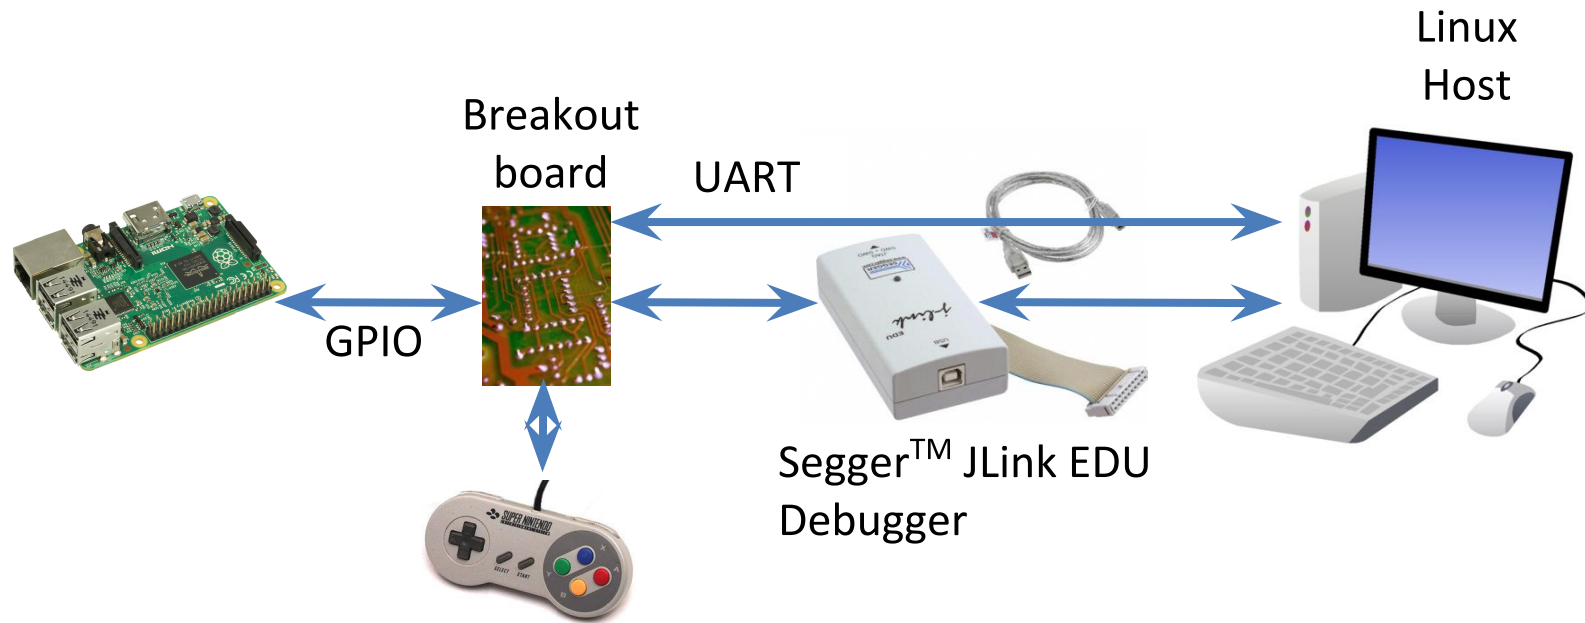

# The Pi as an Embedded Device

- No operating system
  - Direct access to hardware
- Main deliverable: Retro video game
  - Written almost entirely in ARM AL
  - Specialized device driver for input (SNES)
  - Interrupt handling
  - Video programming

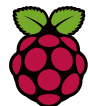

# Lab Setup

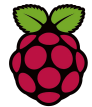

# Observations

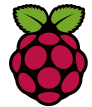

- Improved grades
- Improved student experience
  - Relevant to real-life
- Amazing projects
- Glitchy and not user friendly
- Technical issues with Pi2 & Pi3
  - Jtag compatibility
- Unable to work from home

# Sample Projects

# Sample Projects

# Undergraduate Research Experiences with the Raspberry Pi

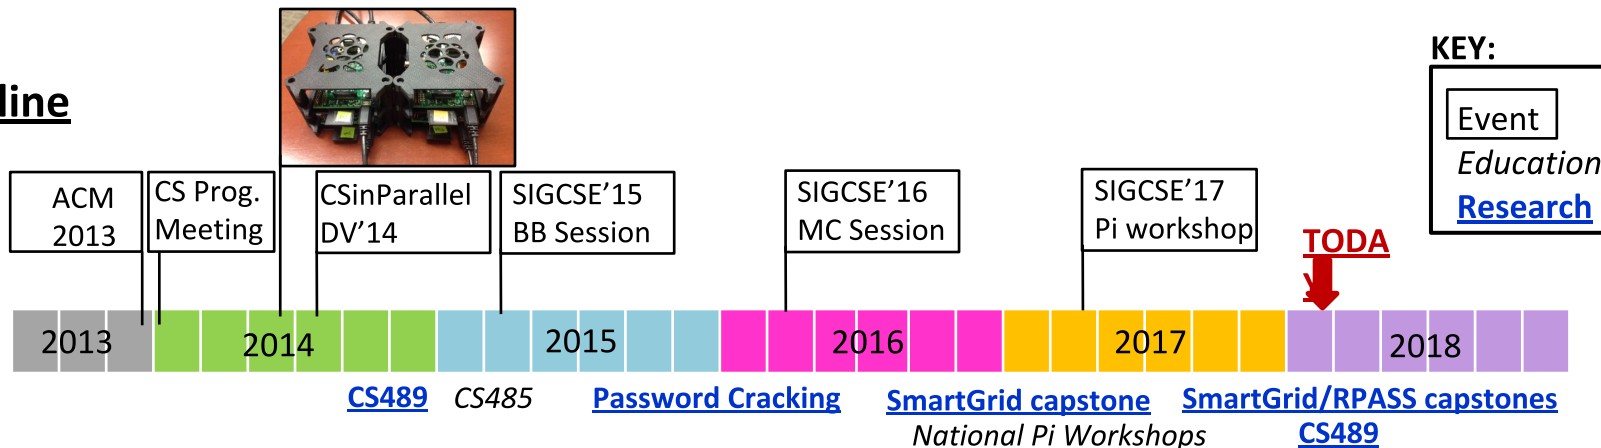

Suzanne J. Matthews  
West Point

# Overview

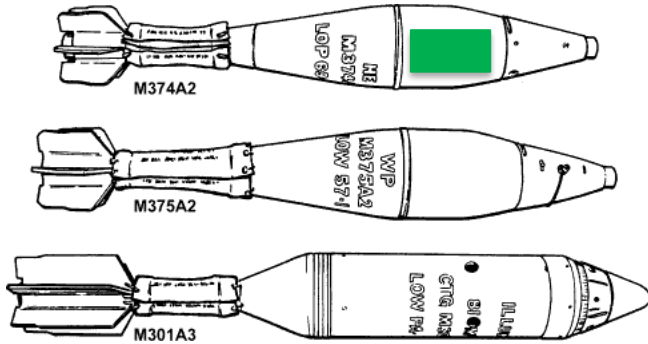

- XE401/XE402: Year-long capstone experiences that explored Raspberry Pis for energy-efficient parallel computing and data summarization (student teams).
- CS489 – Independent Studies (one on one).
- CS485 – Parallel Computing Elective

## Timeline

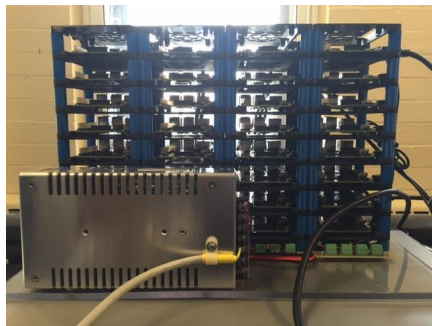

# Project 1: Smart Mortar System

- Goal: Simulate the firing of a “smart” mortar system with 20 rounds in the magazine and a wireless “magazine server” sending firing commands using a cluster of Raspberry Pi B+s.
  - 20 Pis simulated mortars, one Pi simulated the magazine server.
  - 2015 Journal Paper (Ramirez2015) with two faculty and one student co-author

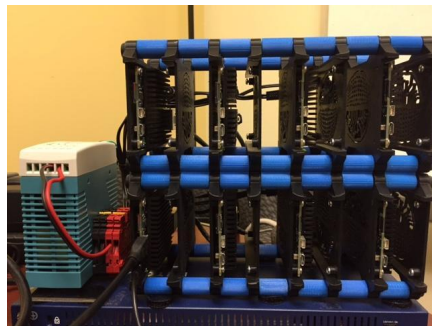

# Project 2: Password Cracking

- Goal: Determine if SBC clusters can outperform a high-end laptop at password cracking at similar cost
  - Started out as student project in CS485, but...
  - Compared performance of password cracking on each cluster using JtR+MPI hybrid
  - Three faculty co-authors on CyconUS paper (Matthews2016)

128-core Raspberry Pi 2 Cluster

128-core Parallella Cluster

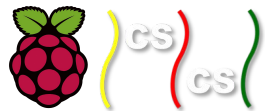

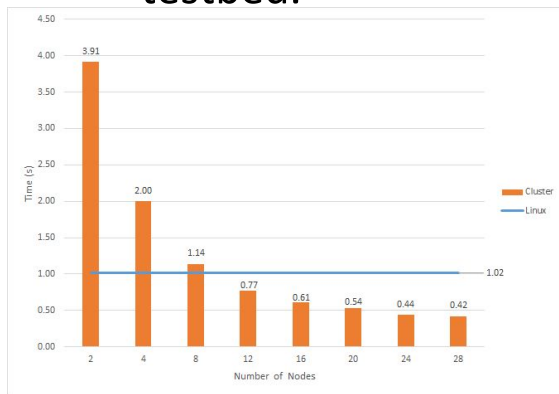

Intel Quad-Core Macbook Pro

# Project 3: Anomaly Detection

- Goal: Assess feasibility of using a R-Pi 2 cluster for anomaly detection in the smart grid.
  - Pthreads + MPI hybrid.
  - 2017 URTC Paper (Candelario2017) that won Best Paper.
- Follow-up: 2017 UEMCON paper exploring use of one R-Pi 3 (instead of a cluster!)
  - This year's capstone team will be integrating Raspberry Pi 3 into smart grid testbed.

# Reflection

- Products: 4 papers with 4 distinct faculty co-authors and 3 distinct student co-authors. One student paper won best paper.
- Great system to drive home networking principles along with parallel programming.
  - Students had to deal with NFS issues, networking issues, power issues, etc.
  - This can be a double-edged sword!
- Students and faculty really enjoy the “hands-on” aspect.
  - Pis have a definite “cool” factor that seems to attract students.
  - Great way to help students who aren’t academic “superstars” realize their potential.

# A First-year Course:

## “Introduction to computing by tasting Raspberry Pi”

Elizabeth Shoop  
Macalester College

# Context: small liberal arts college

- First semester course of 16 first-year students
- They live near each other in the dorms
- I am their academic advisor
- Met 2 days/week for 1.5 hours

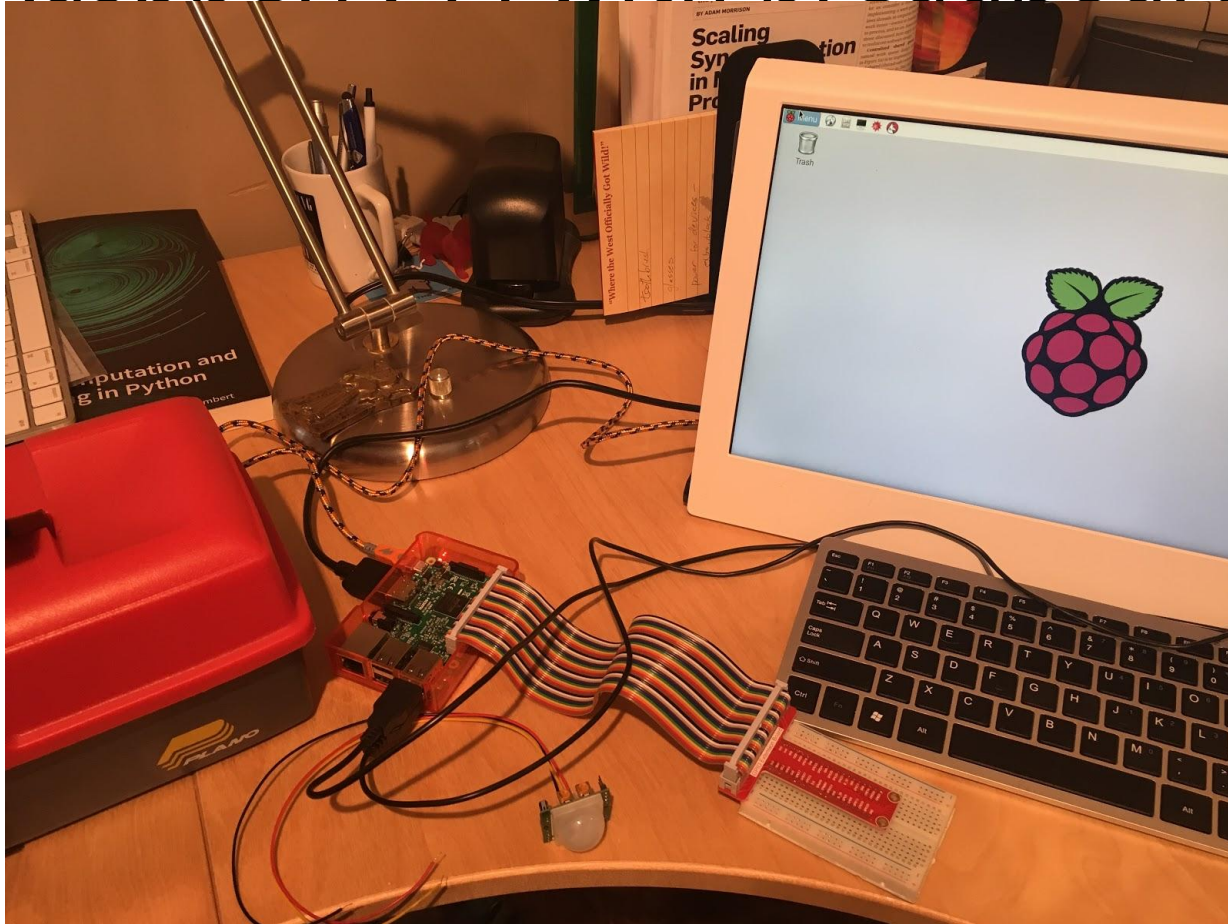

# Each Student Received:

# Raspberry Pi with breadboard

# Active Classroom Activities

## jupyter/iPython Notebook

- Daily directed exercises where they spend their time coding
  - First just Python
    - Using same activities as our traditional CS1 course
  - Then added use of connected devices
    - LED light
    - Button and touch switch
    - Joystick
    - LCD screen
    - Others

# Class Projects: teams of 3 (except 2 singles)

- GoPiGo robot controlled with a joystick
- Home automation simulation
- Motion sensing
- Weather conditions from weather underground displayed on small LCD screen
- 'Beatbox' - buttons control music snippets
- Blackjack game
- Role-playing game

# The Good

- FUN!
- Collaborative work
  - In class
  - Outside class at the dorms
    - Assigned special undergrad TAs who held office hours

# The Not So Good

- Setup time every class period
  - Was a hassle outside class for some:
    - Preferred their own computer, didn't like carrying toolbox and monitor
- Giving notebooks to them and turning in their work was challenging
  - OS doesn't support Google Drive or Dropbox
  - Used box.com, which had webdav support (problematic)
- Students would have liked to use Linux more

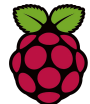

# 75-Minute Session Overview

1. Panelist presentations (~50 min.)
2. All-group Q&A (~25 min.)

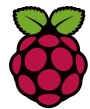

These slides will be available at:

**CSinParallel.org > Workshops > SIGCSE2018**

# Participants in this Session

Participant	Institution
<b>Joel Adams</b>	Calvin College
<b>Richard Brown</b>	St. Olaf College
<b>Jalal Kawash</b>	University of Calgary
<b>Suzanne Matthews</b>	West Point
<b>Libby Shoop</b>	Macalester College

# 75-Minute Session Overview

1. Panelist presentations (~50 min.)
2. All-group Q&A (~25 min.)

Materials for this session are available at:

**[CSinParallel.org > Workshops > SIGCSE2018](#)**

Thank you!
